

1 Polynomial Practice

Note 8

(a) If f and g are non-zero real polynomials, how many real roots do the following polynomials have at least? How many can they have at most? (Your answer may depend on the degrees of f and g .)

(i) $f + g$

(ii) $f \cdot g$

(iii) f/g , assuming that f/g is a polynomial

(b) Now let f and g be polynomials over $\text{GF}(p)$.

(i) We say a polynomial $f = 0$ if $\forall x, f(x) = 0$. Show that if $f \cdot g = 0$, it is not always true that either $f = 0$ or $g = 0$.

(ii) How many f of degree *exactly* $d < p$ are there such that $f(0) = a$ for some fixed $a \in \{0, 1, \dots, p-1\}$?

(c) Find a polynomial f over $\text{GF}(5)$ that satisfies $f(0) = 1, f(2) = 2, f(4) = 0$. How many such polynomials of degree at most 4 are there?

2 Lagrange Interpolation in Finite Fields

Note 8

Find a unique polynomial $p(x)$ of degree at most 2 that passes through points $(-1, 3)$, $(0, 1)$, and $(1, 2)$ in modulo 5 arithmetic using the Lagrange interpolation.

(a) Find $p_{-1}(x)$ where $p_{-1}(0) \equiv p_{-1}(1) \equiv 0 \pmod{5}$ and $p_{-1}(-1) \equiv 1 \pmod{5}$.

(b) Find $p_0(x)$ where $p_0(-1) \equiv p_0(1) \equiv 0 \pmod{5}$ and $p_0(0) \equiv 1 \pmod{5}$.

(c) Find $p_1(x)$ where $p_1(-1) \equiv p_1(0) \equiv 0 \pmod{5}$ and $p_1(1) \equiv 1 \pmod{5}$.

(d) Construct $p(x)$ using a linear combination of $p_{-1}(x)$, $p_0(x)$, and $p_1(x)$.

3 Secrets in the United Nations

Note 8

A vault in the United Nations can be opened with a secret combination $s \in \mathbb{Z}$. In only two situations should this vault be opened: (i) all 193 member countries must agree, or (ii) at least 55 countries, plus the U.N. Secretary-General, must agree.

(a) Propose a scheme that gives private information to the Secretary-General and all 193 member countries so that the secret combination s can only be recovered under either one of the two specified conditions.

- (b) The General Assembly of the UN decides to add an extra level of security: each of the 193 member countries has a delegation of 12 representatives, all of whom must agree in order for that country to help open the vault. Propose a scheme that adds this new feature. The scheme should give private information to the Secretary-General and to each representative of each country.

4 To The Moon!

Note 8

A secret number s is required to launch a rocket, and Alice distributed the values $(1, p(1)), (2, p(2)), \dots, (n+1, p(n+1))$ of a degree n polynomial p to a group of $\$GME$ holders Bob_1, \dots, Bob_{n+1} . As usual, she chose p such that $p(0) = s$. Bob_1 through Bob_{n+1} now gather to jointly discover the secret. However, Bob_1 is secretly a partner at Melvin Capital and already knows s , and wants to sabotage Bob_2, \dots, Bob_{n+1} , making them believe that the secret is in fact some fixed $s' \neq s$. How could he achieve this? In other words, what value should he report (in terms variables known in the problem, such as s', s or y_1) in order to make the others believe that the secret is s' ?
